Authorization for this examiner's amendment was given in a telephone interview with Jay Knoblock on 05 September 2008.

The application has been amended as follows:

106. (currently amended) A method for mixing two digital audio files, the method comprising:

inputting a first digital audio file in its entirety and a second digital audio file in its entirety;

calculating, by a digital processing unit, audio file characteristic values for the first and second digital audio files, the characteristic values operable to identify average values and peak absolute values for each of the two digital audio files;

generating first and second scale factors based on the audio file characteristic values including the average levels and peak absolute values for each of the digital audio files and a maximum value allowed by an output audio file format;

generating a first scaled digital audio file by applying the first scale factor to the originally input first digital audio file, the first scale factor operable to adjust the identified average level and peak absolute value of the first digital audio file;

generating a second scaled digital audio file, which has an output level that is substantially equivalent to an output level of the first scaled digital audio file, by applying the second scale factor to the originally input second digital audio file, the second scale factor operable to adjust the identified average level and peak absolute value of the second digital audio file;

generating a combined scaled digital audio file by combining the first scaled digital audio file and the second scaled digital audio file such that the combined scaled digital audio file may be played back.
